

Assignment 9

Sunday, November 29, 2020 9:36 PM

Coefficients Explanations

- For every unit that a mother's age increases, the log odds of a child being born underweight decreases by .030
- For every unit that weight of mother at last menstrual period increases, the log odds of the child being born underweight decreases by .015
- However the P-value of age is greater than 0.05 and therefore is unreliable
